Preface

This assessment was carried out by staff of the National Industrial Chemicals Notification and Assessment Scheme (NICNAS) using the Inventory Multi-tiered Assessment and Prioritisation (IMAP) framework.

The IMAP framework addresses the human health and environmental impacts of previously unassessed industrial chemicals listed on the Australian Inventory of Chemical Substances (the Inventory).

The framework was developed with significant input from stakeholders and provides a more rapid, flexible and transparent approach for the assessment of chemicals listed on the Inventory.

Stage One of the implementation of this framework, which lasted four years from 1 July 2012, examined 3000 chemicals meeting characteristics identified by stakeholders as needing priority assessment. This included chemicals for which NICNAS already held exposure information, chemicals identified as a concern or for which regulatory action had been taken overseas, and chemicals detected in international studies analysing chemicals present in babies' umbilical cord blood.

Stage Two of IMAP began in July 2016. We are continuing to assess chemicals on the Inventory, including chemicals identified as a concern for which action has been taken overseas and chemicals that can be rapidly identified and assessed by using Stage One information. We are also continuing to publish information for chemicals on the Inventory that pose a low risk to human health or the environment or both. This work provides efficiencies and enables us to identify higher risk chemicals requiring assessment.

The IMAP framework is a science and risk-based model designed to align the assessment effort with the human health and environmental impacts of chemicals. It has three tiers of assessment, with the assessment effort increasing with each tier. The Tier I assessment is a high throughput approach using tabulated electronic data. The Tier II assessment is an evaluation of risk on a substance-by-substance or chemical category-by-category basis. Tier III assessments are conducted to address specific concerns that could not be resolved during the Tier II assessment.

These assessments are carried out by staff employed by the Australian Government Department of Health and the Australian Government Department of the Environment and Energy. The human health and environment risk assessments are conducted and published separately, using information available at the time, and may be undertaken at different tiers.

This chemical or group of chemicals are being assessed at Tier II because the Tier I assessment indicated that it needed further investigation.

Grouping Rationale

The chemicals covered by this assessment are polymers that contain formaldehyde as a monomer. The polymers in this group may be used in the production of formaldehyde resin products and non-resin consumer products such as cosmetics and household cleaning products. In these applications, the formaldehyde resin and/or products manufactured may contain free formaldehyde or may release some or all the formaldehyde they contain (formaldehyde donors). The hazardous properties of free formaldehyde or released formaldehyde are expected to dominate the toxicity profile of these polymers despite minor differences in individual solubility in biological systems.

Polymers which may have other degradation products of concern such as nonylphenols or bisphenol A are not included in this assessment as the degradants may potentially have additional risks to human health.

Import, Manufacture and Use

Australian

Australian industrial uses were reported under previous mandatory and/or voluntary calls for information for the polymers identified by the following Chemical Abstract Service (CAS) numbers: 68002-20-0, 68082-96-2, and 9011-05-6.

The polymers identified by the Chemical Abstract Service (CAS) numbers have reported domestic uses as follows:

- in coatings (CAS Nos 25085-50-1; 9039-25-2; 9084-06-4);
- in adhesives (CAS Nos 25085-50-1; 28064-14-4; 55185-45-0);
- in automotive aftermarket products including adhesives, coatings and sealants (CAS No 68037-42-3).

The information provided by industry during the information gathering stage of the Priority Existing Chemical (PEC) assessment of formaldehyde indicated that formaldehyde-based products such as formaldehyde resins, film processing products, surface coating products, and preservatives are imported to Australia. Other uses may include cosmetic products and other consumer products such as fabric softeners, surface liquid cleaners and dishwashing liquids (NICNAS, 2006).

International

The following international uses have been identified through Galleria Chemica, the United States (US) Environmental Protection Agency's Aggregated Computer Toxicology Resource (ACToR), the European Commission Cosmetic Ingredients and Substances (CosIng) database, the United States (US) Personal Care Products Council International Nomenclature of Cosmetic Ingredients (INCI) Dictionary, the US Department of Health and Human Services Household Products Database, the Substances in Preparations in Nordic Countries (SPIN), the Health Canada and Environment and Climate Change Canada report (Government of Canada, 2016), and the European Chemicals Agency (ECHA) report on formaldehyde and formaldehyde releasers (ECHA, 2017).

Some polymers in this group have reported cosmetic uses including as film forming agents, in nail conditioning, in skin conditioning, in hair conditioning, and as antimicrobial agents.

Some polymers in this group have reported domestic uses including as antimicrobial preservatives in household cleaning products (dishwashing and laundry liquids, surface cleaners and polishes), in specialty paints, adhesives, sealants, lubricants, and wall insulation.

Most of the polymers in this group have reported commercial uses as binders, defoaming agents, epoxy hardeners, and in the production of resins for the manufacture of pressed wood products, textile treatments, paper treating and coating.

Some polymers in this group have reported site-limited uses including as intermediates for the manufacture of synthetic adhesives.

Some polymers in this group have reported non-industrial uses as antiseptics, fungicides, bactericides, and fungicides.

Restrictions

Australian

There are no restrictions specific to the use of these polymers in Australia.

The polymers in this group may contain free formaldehyde or formaldehyde released from formaldehyde donors. These polymers may be covered by the entry for 'Formaldehyde'. Formaldehyde is listed in Schedule 6 and Schedule 10 of the Poisons Standard—the Standard for the Uniform Scheduling of Medicines and Poisons (SUSMP) (2018) as follows:

in Schedule 6:

'FORMALDEHYDE (excluding its derivatives) in preparations containing 0.05 per cent or more of free formaldehyde **except:**

- (a) for human therapeutic use;
- (b) in oral hygiene preparations;
- (c) in nail hardener cosmetic preparations containing 5 per cent or more of free formaldehyde;
- (d) in nail hardener cosmetic preparations containing 0.2 per cent or less of free formaldehyde when labelled with the statement: PROTECT CUTICLES WITH GREASE OR OIL;
- (e) in all other cosmetic preparations; or
- (f) in other preparations containing 0.2 per cent or less of free formaldehyde when labelled with the warning statement: CONTAINS FORMALDEHYDE.'

Schedule 6 chemicals are labelled with 'Poison' and are 'substances with a moderate potential for causing harm, the extent of which can be reduced through the use of distinctive packaging with strong warnings and safety directions on the label'.

in Schedule 10:

'FORMALDEHYDE (excluding its derivatives):

- (a) in oral hygiene preparations containing more than 0.1 per cent of free formaldehyde;
- (b) in aerosol sprays for cosmetic use containing 0.005 per cent or more of free formaldehyde;
- (c) in nail hardener cosmetic preparations containing 5 per cent or more of free formaldehyde; or
- (d) in all other cosmetic preparations containing 0.05 per cent or more of free formaldehyde **except** in preparations containing 0.2 per cent or less of free formaldehyde when labelled with the warning statement: CONTAINS FORMALDEHYDE.'

Schedule 10 chemicals are 'substances, other than those included in Schedule 9, of such danger to health as to warrant prohibition of sale, supply and use'.

Formaldehyde donors are mentioned in the definition of free formaldehyde in Part I of the *Poisons Standard* (SUSMP) as follows:

"Free formaldehyde" includes all hydrated and non-hydrated formaldehyde present in aqueous solution, including methylene glycol and formaldehyde released from formaldehyde donors.

International

No known restrictions specific to these polymers have been identified.

However, the polymers in this group may contain free formaldehyde or release formaldehyde from formaldehyde donors, and may be subject to the restrictions on formaldehyde, under certain conditions.

Using formaldehyde in cosmetics in the European Union (EU) is subject to the restrictions described in EU Regulation, Annex III (List of substances which cosmetic products must not contain except subject to the restrictions laid down) and Annex V (List of preservatives allowed in cosmetic products) (CosIng).

Formaldehyde may be present in the following cosmetic and personal care products (CosIng):

- nail hardening products at a maximum concentration of 5 % in ready for use preparation; if the concentration exceeds 0.05 %, the label must indicate 'Contains formaldehyde';
- preservative for oral products with a maximum concentration of 0.1 % as free formaldehyde in ready for use preparation; and
- preservatives for other products with a maximum concentration of 0.2 % as free formaldehyde in ready for use preparation.

Existing Work Health and Safety Controls

The polymers are not listed on the Hazardous Chemical Information System (HCIS) (Safe Work Australia).

Exposure Standards

Australian

There are no Australian exposure standards for the individual polymers in this group.

Safe Work Australia has an exposure standard for formaldehyde. Where the polymers in this group contain free formaldehyde or release formaldehyde, exposure standards of 1.2 mg/m³ (1 part per million) time weighted average (TWA) and 2.5 mg/m³ (2 parts per million) short term exposure limit (STEL) apply.

International

There are no international exposure standards for the individual polymers in this group.

Health Hazard Information

Where the polymers in this group do not contain free formaldehyde or groups which readily decompose to formaldehyde, no significant health effects are expected.

There are no data available on the health hazards of the polymers in this group. However, it is considered that the formaldehyde released from the decomposition of these polymer resins will be the critical driver of toxicity. Free formaldehyde is extremely reactive, and its key health hazards are those identified in the NICNAS Priority Existing Chemical (PEC) assessment of formaldehyde (NICNAS, 2006) and the Inventory Multi-tiered Assessment and Prioritisation (IMAP) Tier II human health assessments of formaldehyde donors (NICNASa).

In Australia, at least two major uses where the polymers may be used in the manufacture of formaldehyde-containing products were documented. The polymer resins may be used as adhesives in the manufacture of resins to make pressed wood products (plywood, particle board and medium density fibreboard (MDF)). The polymers are also used in the manufacture of formaldehyde resin products in the textile industry (printing inks, dyes and textile finishing products). Other minor uses may include being an ingredient in cosmetic products and other consumer products such as fabric softener, surface liquid cleaners and dishwashing liquids (NICNAS 2006).

Formaldehyde can be released as a vapour, due to off-gassing from products containing formaldehyde-based resins. Formaldehyde release is highest in newly manufactured pressed wood products, and decreases over time. Increased levels of formaldehyde in air can occur if resin is heated to temperatures where it decomposes or when in contact with high humidity levels. Breathing formaldehyde vapour can result in irritation of nerves in the eyes and nose, which may cause burning, stinging or itching sensations, a sore throat, teary eyes, blocked sinuses, runny nose, and sneezing (NICNAS, 2006).

Formaldehyde is released in some textile finishes, such as those conferring crease resistance, while the garment is new. These finishes are most likely to be used in fabrics that otherwise crease easily, such as cotton or wool. The most likely health effects arising from the release of formaldehyde from textile products such as blankets and clothing are irritation of the eyes and nose, and allergic reactions on skin in contact with the fabric.

Instances of dermatitis arising from wearing garments containing high levels of formaldehyde have been documented (NICNAS, 2006).

Formaldehyde-containing products may also be used as a preservative, drying agent and/or surfactant in cosmetics and household cleaners. In these applications, the biocidal effects mechanism involves release of formaldehyde into aqueous solutions secondary to hydrolytic degradation of the polymers (Anderson BE et al., 2007). The degree of completeness of formaldehyde released in these products will depend on the concentration of the preservative in the product, the percentage of water in the product, the rate of formaldehyde release from the specific preservative, and the length of time since formulation. Skin contact with formaldehyde solution can cause skin rashes and allergic skin reactions. For individuals allergic to formaldehyde, even very low levels of formaldehyde are likely to cause skin reactions (NICNAS, 2018).

Risk Characterisation

Critical Health Effects

If the polymers in this group do not readily release free formaldehyde, none of the polymers are expected to have significant health effects.

However, where the polymers in this group degrade to free formaldehyde or are capable of releasing formaldehyde, the critical health effects for risk characterisation include sensory irritation and allergic skin reactions.

Sensory irritation is defined as irritation of the nerve endings in the eyes and nose and can produce symptoms such as stinging or burning sensations in the eyes, nose and/or a sore throat. The level of formaldehyde in the air at which these symptoms have

been known to start to occur is 0.5 parts per million (ppm). Long term exposure to higher levels of gaseous formaldehyde may lead to certain cancers (NICNAS, 2006).

Some polymers in this group have been evaluated by Health Canada and Environment and Climate Change Canada as part of the Chemicals Management Plan's Rapid Screening of Polymers (Government of Canada, 2016). The polymers subject to the screening were assessed as not posing a concern to human health and the environment.

Public Risk Characterisation

Pressed wood products are used in the construction of both structural and decorative items such as wall and ceiling linings, flooring, cabinetry and furniture. Pressed wood products are commonly used in caravans, mobile homes and demountable buildings, but may also be found in conventional residences. Australian Standards limit the amount of formaldehyde that can be released from reconstituted wood-based panels and flooring wood products supplied according to the Australian Standards (AS/NZS 1859.2:2004 - Australian/New Zealand Standard: Reconstituted wood-based panels—Specifications) also have the classification of formaldehyde emission limits indicated on the label (Standards Australia/Standards New Zealand, 2004). Use of wood products labelled in this way should ensure wood products of only low formaldehyde release are used.

Formaldehyde resins are used in textile finishing that produce a durable 'permanent press' type fabric. Carpets, curtains, blankets, sheets, garments and upholstery items used in the home may be treated with formaldehyde-containing products. Formaldehyde is very water soluble, and washing the new garments or blankets before wearing or using will generally reduce the amount of formaldehyde released from the fabric.

The Australian Competition and Consumer Commission (ACCC) has published safety guidance on concentrations of formaldehyde in clothing, textiles and clothing finishes (ACCC, 2014).

The main potential public exposure to formaldehyde-containing products is through inhalation of indoor air, which generally contains higher levels of formaldehyde than outside air. The levels of formaldehyde in the air in a home will depend on a number of factors, including the presence of emission sources such as those listed above, the age and use patterns of the sources, the temperature and humidity, and ventilation of the home.

NICNAS has recommended an indoor air guidance value for formaldehyde of 80 parts per billion (ppb) (NICNAS, 2006).

The majority of the types of consumer products listed above will contain concentrations of formaldehyde of <0.2%. Before allowing occupation of mobile homes and of relocatable buildings by members of the public, manufacturers should aim to minimise levels of formaldehyde in indoor air and these should be designed to ensure the recommended indoor air guidance of 80 ppb is not exceeded. The pressed wood products should also be allowed to outgas under conditions of good ventilation (NICNAS, 2006).

Overall, the risk to the public using the above products is low, both from breathing formaldehyde vapour and from absorption of formaldehyde into the skin. At these formaldehyde levels in public spaces, the carcinogenic risk is very low (NICNAS, 2006).

The function of the formaldehyde in cosmetic and household cleaning products is as a preservative, drying agent and/or surfactant. The level of exposure to formaldehyde through use of products that contact the skin will vary according to the products used and individual habits in application. While the risk of health effects is generally low, individuals already sensitised to formaldehyde can experience skin reactions even at low concentrations, and so caution is recommended in the use of formaldehyde-containing products that come into contact with the skin. The SUSMP specifies limits for the levels of formaldehyde in cosmetic and domestic products (SUSMP, 2018). The current controls in Schedule 6 and 10 of the SUSMP (see Restrictions - Australian section) are considered adequate to minimise the risk to public health posed by domestic and cosmetic products containing the polymers. Therefore, the polymers in this group are not considered to pose an unreasonable risk to public health provided the concentrations of the free formaldehyde present in products meet the SUSMP limit.

Occupational Risk Characterisation

Available information on Australian use scenarios indicates that workers are potentially exposed to formaldehyde-containing products by both inhalation and skin contact. Ingestion is unlikely to be a route of exposure in the occupational environment.

Workers may be exposed by breathing in fumes from formaldehyde-containing products as a result of off-gassing from unsealed or freshly cut pressed wood and the associated dust particles. Exposure can also occur from breathing in dust particles containing formaldehyde.

Inhalation of aerosol droplets from accidental releases or some application modes such as spraying or brushing is also possible. Formaldehyde-containing particles can be inhaled when paraformaldehyde or formaldehyde resin powder is being used in the workplace.

Dermal exposure may occur from spills and splashes and exposure of the skin to aerosol droplets during formulation process.

Given the critical health effects, products containing the polymers may pose an unreasonable risk to workers unless adequate control measures to minimise dermal and inhalation exposure to the products are implemented. These polymers should be appropriately labelled to ensure that a person conducting a business or undertaking (PCBU), e.g. employer, at a workplace, has adequate information to determine appropriate controls.

Occupational risks to formaldehyde exposures can be mitigated by ensuring effective ventilation when these products are used in indoor environments. Handling and storage of pressed wood products should only be undertaken in well ventilated areas. When machining pressed wood products, the use of local exhaust ventilation which extracts dusts and vapours at source is recommended in controlling exposure to formaldehyde. If symptoms of burning, stinging or itching of the eyes and/or nose, sore throat, watery eyes, blocked sinuses, runny nose or sneezing occurs, the worker is advised to move to an area with fresh air.

NICNAS Recommendation

Current risk management measures are considered adequate to protect public and workers' health and safety, provided that all requirements are met under workplace health and safety, and poisons legislation as adopted by the relevant state or territory. No further assessment is required.

Companies using or marketing these polymers should seek sufficient information to determine whether the polymer contains free formaldehyde or releases formaldehyde, and take appropriate risk management measures to control the hazards stipulated in the HCIS, and the advice and controls in the SUSMP.

It is recommended that occupational and public health controls for the formaldehyde vapours released from these polymers be implemented in line with the recommendations of the NICNAS PEC assessment report on formaldehyde (NICNAS 2006).

Regulatory Control

Work Health and Safety

The polymers in this group are not recommended for classification and labelling under the Globally Harmonised System of Classification and Labelling of Chemicals (GHS). Should empirical data become available for the individual polymers indicating that a classification is appropriate, the data may be used to make recommendation for GHS classifications.

The recommendation for GHS classifications does not consider classification of physical hazards and environmental hazards.

From 1 January 2017, under the model Work Health and Safety Regulations, chemicals are no longer to be classified under the Approved Criteria for Classifying Hazardous Substances system.

Public health

At present, free formaldehyde or formaldehyde released from the products fall within the scope of the listing of 'Formaldehyde' in Schedules 6 and 10 of the SUSMP. Therefore, products containing the polymers in this group with more than 0.05 % free or readily available formaldehyde should be labelled in accordance with state and territory legislation (SUSMP, 2018).

Advice for consumers

Products containing the polymers in this group should be used according to the instructions on the label.

Advice for industry

Control measures

Control measures to minimise the risk from dermal and inhalation exposure to the polymer in this group containing free formaldehyde or is a formaldehyde donor should be implemented in accordance with the hierarchy of controls. Approaches to minimise risk include substitution, isolation and engineering controls. Measures required to eliminate or minimise risk arising from storing, handling and using a hazardous chemical depend on the physical form and the manner in which the chemical is used. Examples of control measures which may minimise the risk include, but are not limited to:

- using closed systems or isolating operations;
- using local exhaust ventilation to prevent the chemical from entering the breathing zone of any worker;
- health monitoring for any worker who is at risk of exposure to the chemical if valid techniques are available to monitor the effect on the worker's health;
- air monitoring to ensure control measures in place are working effectively and continue to do so;
- minimising manual processes and work tasks through automating processes;
- work procedures that minimise splashes and spills;
- regularly cleaning equipment and work areas; and
- using protective equipment that is designed, constructed, and operated to ensure that the worker does not come into contact with the chemical.

Guidance on managing risks from hazardous chemicals are provided in the *Managing risks of hazardous chemicals in the workplace—Code of practice* available on the Safe Work Australia website.

Obligations under workplace health and safety legislation

Information in this report should be taken into account to help meet obligations under workplace health and safety legislation as adopted by the relevant state or territory. This includes, but is not limited to:

- ensuring that hazardous chemicals are correctly classified and labelled;
- ensuring that (material) safety data sheets ((M)SDS) containing accurate information about the hazards (relating to both health hazards and physicochemical (physical) hazards) of the chemical are prepared; and
- managing risks arising from storing, handling and using a hazardous chemical.

Your work health and safety regulator should be contacted for information on the work health and safety laws in your jurisdiction.

Information on how to prepare an (M)SDS and how to label containers of hazardous chemicals are provided in relevant codes of practice such as the *Preparation of safety data sheets for hazardous chemicals—Code of practice* and *Labelling of workplace hazardous chemicals—Code of practice*, respectively. These codes of practice are available from the Safe Work Australia website.

A review of the physical hazards of the chemical has not been undertaken as part of this assessment.
